

Generic Types

Objective

- The objective of this lab is to understand the implementation of dynamic array.

Task

1. Build a program to implement generic Dynamic Array where size of the array is resizable.

```

Class MyArrayList<T extends Comparable<T>>
{
    T[] arr;
    int currIndex;

    MyArrayList() // default constructor to create an array
    {
        arr = (T[])new Comparable[10];
        currIndex=-1;
    }

    MyArrayList(int size) // constructor to create an array
    {
        arr = (T[])new Comparable[size];
        currIndex=-1;
    }

    public String toString(){
        String str="";
        for(int i=0; i<arr.length;i++)
            str=str+arr[i]+"\\n";
        return str;
    }

    public void add (T data) {
        // Assume the insertion is going to perform in ascending order. If array is full then
        // double the arr size by double and insert new value

        

|    |    |    |    |    |  |  |  |     |  |
|----|----|----|----|----|--|--|--|-----|--|
| 12 | 23 | 44 | 56 | 57 |  |  |  | ... |  |
|----|----|----|----|----|--|--|--|-----|--|

currIndex

length-1

    }
}

```

Faculty of Computer Science, IBA

Data Structures (3+1)

Instructor: Quratulain

```
public int find(T value) { ... } // if the value is found in array then return it's index;  
  
public void clear() { ... } // clear array from memory, just assign null to arr.  
  
public T get(int index){ ... } // get a value from given index  
  
public void update(int index, T value) {  
    // update value on given index and maintain a array list in ascending order  
}  
public void remove(T value) { ... }  
    // first find the value in an array then delete the value.  
    // delete through backward movement in an array to overwrite the cells.  
    // update currIndex  
}
```
